

Option 1:

A City Information Query Utility for World Urban Study

- Type in one city name and get its comprehensive information on several aspects.
- Target aspects of information are listed in the UI mockup (*see next page*): General information, economy, environment, society, technology, dataset, and online map.
- Information sources are not fixed. Besides Wikipedia, Baidu, Gaode Map, Google Dataset Search, and APIs in the table provided, you can also add websites of your own based on introductions and hints in the mockup.
- Besides aspects in the mockup, you can also add other aspects if you are interested.

Option 2:

A “Toy” Semantic Code Search Tool

- The user inputs a natural language based statement on the start page, and then the system finds useful source code examples and corresponding online materials to help the user learn programming.
- The system allows users to configure their preferred programming language.
- Please **DO NOT** try to develop a real semantic source code search engine due to time limitations. The real challenges are beyond the scope of your current skillsets.
- Please try to have your system understand not only the keywords in the inputs of the users but also the semantic meanings and context of the inputs. Again, this is already beyond your current skillsets and the scope of this course. Please try to do that by using some existing APIs instead of designing and implementing the learning models by yourself.
- This is just a “toy” application, please feel free to use any available web APIs to enhance the functionalities.
